ОТЧЕТ
по лабораторной работе №3
на тему

Реализация SQL-запросов для создания схемы базы данных
Больница

Студент:

Д.И. Ковальчук

Преподаватель:

Д.В. Куприянова

МИНСК 2024

1 Цель работы

В лабораторной работе выполняется реализация схемы базы данных по ранее построенной реляционной схеме данных (см. лабораторную работу № 2). Требуется сформировать SQL-запросы для создания таблиц базы данных и выполнить их в СУБД. Требуется заполнить таблицы данными с помощью оператора INSERT.

2 Порядок выполнения работы

1) Создать в СУБД новую схему данных для хранения пользовательских объектов (см. часть 2).

2) В этой новой схеме данных с помощью скрипта с запросами на языке DDL SQL реализовать таблицы, соответствующие реляционным отношениям схемы данных полученной в лабораторной работе No2, с помощью одного (желательно) оператора CREATE TABLE для каждой таблицы в следующем порядке:

- реализовать простую структуру таблиц, включающую только набор столбцов с добавлением описаний первичного ключа;
- дополнить описание таблицы реализацией ограничений для описания внешних ключей; для внешних ключей установить свойства контроля целостности данных (каскадное удаление и обновление), если это возможно в целевой СУБД;
- дополнить описание таблицы реализацией ограничений для описания бизнес-правил;
- дополнить описание таблицы реализацией комментариев для значимых элементов таблицы.

3) Заполнить с помощью SQL-скрипта с использованием оператора INSERT таблицы строками данных для проверки правильного выбора первичных ключей и работоспособности ссылок между таблицами:

- строками данных сначала заполнять мастер-таблицы (или таблицы, которые НЕ ссылаются на другие таблицы);
- в каждую таблицу добавить 30 строк осмысленных данных;
- если не удастся добавить данные в таблицу по причине нарушения уникальности первичного ключа, то следует перепроверить описание этого первичного ключа и его смысл для реального мира;
- если не удастся добавить данные в таблицу по причине нарушения ссылочной целостности, то следует убедиться, что целевые данные существуют, иначе перепроверить описание внешнего ключа.

4) Рассмотреть простые действия по изменению структуры таблицы (переименование столбца таблицы, добавление и удаление ограничений на столбец таблицы или всю таблицу) и реализовать их с помощью оператора ALTER TABLE.

5) Создать временную таблицу с помощью оператора CREATE TABLE и удалить ее с помощью оператора DROP TABLE.

```
    surname_of_head text,  
    first_name_of_head text,  
    middle_name_of_head text  
);
```

```
CREATE TABLE patient (  
    history_number integer PRIMARY KEY,  
    type_of_treatment text,  
    surname text,  
    first_name text,  
    middle_name text,  
    department_name text references department(department_name)  
);
```

```
CREATE TABLE diagnosis(  
    diagnosis_id integer PRIMARY KEY,  
    code text,  
    diagnosis_name text,  
    date_ date,  
    history_number integer references patient(history_number)  
);
```

```
CREATE TABLE doctor(  
    doctor_id integer PRIMARY KEY  
    surname text,  
    first_name text,  
    middle_name text,  
    speciality text,  
    qualification text  
);
```

```
CREATE TABLE service(  
    service_name text PRIMARY KEY,  
    price_for_belarusian integer,
```

```
price_for_foreigners integer  
);
```

```
CREATE TABLE test(  
test_id integer PRIMARY KEY,  
name_of_nurse text,  
test_name text,  
date_ date,  
history_number integer references patient(history_number)  
);
```

```
CREATE TABLE department_doctor(  
department_name text references department(department_name),  
doctor_id integer references doctor(doctor_id),  
PRIMARY KEY(department_name, doctor_id)  
);
```

```
CREATE TABLE doctor_service(  
service_name text references service(service_name),  
doctor_id integer references doctor(doctor_id),  
PRIMARY KEY(service_name, doctor_id)  
);
```

```
CREATE TABLE doctor_patient(  
history_number integer references patient(history_number),  
doctor_id integer references doctor(doctor_id),  
date_ date,  
note text,  
PRIMARY KEY(history_number, doctor_id, date_)  
);
```

Для добавления ограничений используются конструкция **ADD CONSTRAINT** в связке с оператором **ALTER**. Пример добавления условия, что ни одно из полей не нулевое, для таблицы **service** представлен ниже:

```
ALTER TABLE IF EXISTS service
ADD CONSTRAINT not_null CHECK(
service_name IS NOT NULL AND
price_for_belarusian IS NOT NULL AND
price_for_foreigners IS NOT NULL
);
```

Пример добавления комментария к таблице department_doctor:

```
COMMENT ON TABLE department_doctor
IS 'Intermediate table between tables department and doctor';
```

Пример установки свойства контроля целостности данных (каскадное удаление и обновление) в таблице test:

```
ALTER TABLE test
ADD CONSTRAINT del_upd
FOREIGN KEY (history_number)
REFERENCES patient (history_number)
ON DELETE CASCADE
ON UPDATE CASCADE
```

Заполнение таблиц test, doctor, diagnosis, patient, department при помощи оператора INSERT INTO:

```
INSERT INTO department (department_name, number_of_beds,
surname_of_head, first_name_of_head, middle_name_of_head)
VALUES
('Cardiology', 50, 'Smith', 'John', 'Alexander'),

Рисунок 3.11 – Заполненная таблица test.

Также была создана реляционная диаграмма, приведенная на рисунке 3.12.

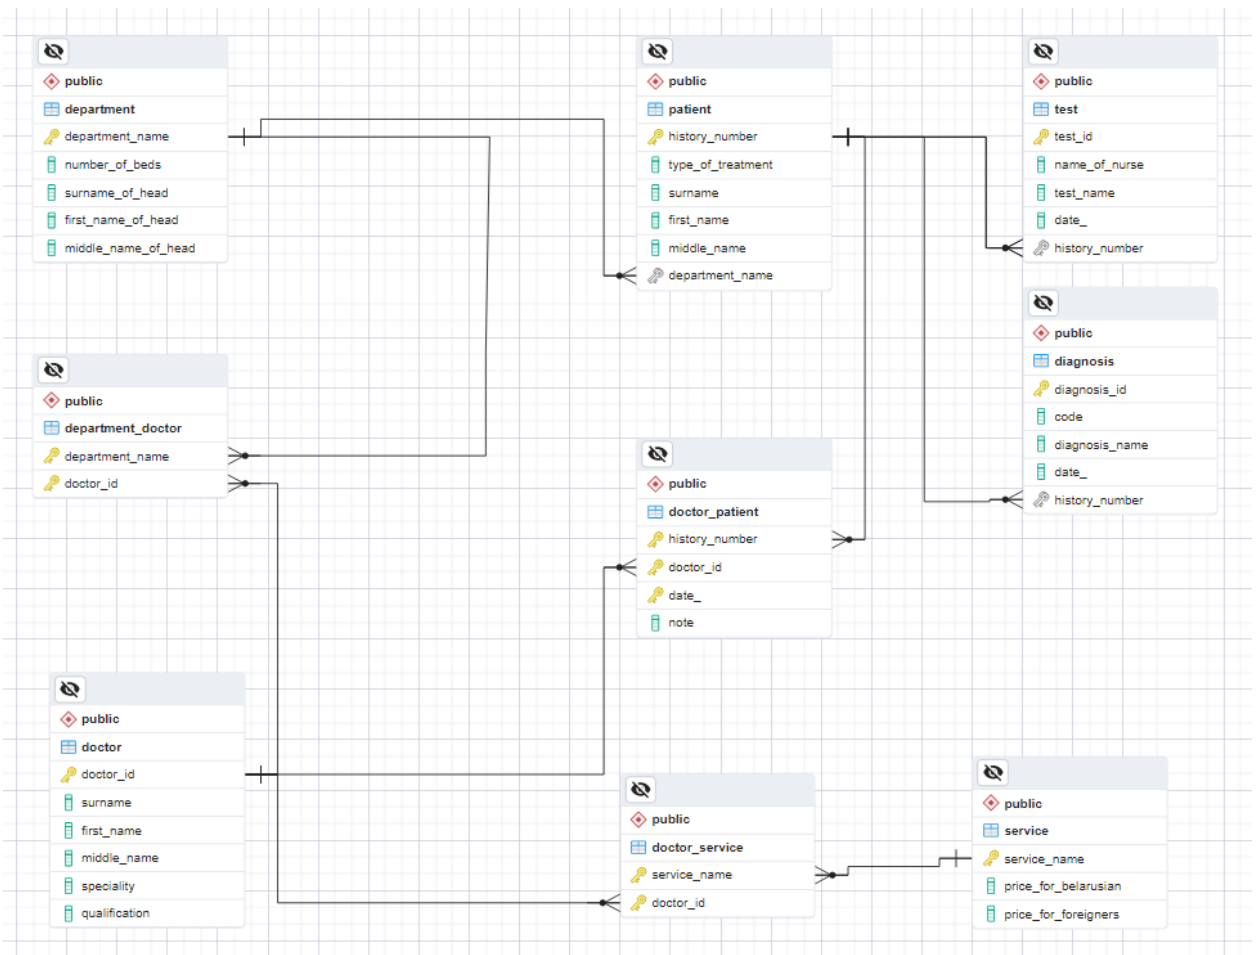

Рисунок 3.12 – Реляционная модель «Больница» в «PgAdmin 4»

После сравнения полученной диаграммы и схемы реляционной модели из отчета по лабораторной работе №2 различий в структуре этих диаграмм не было обнаружено.

Результатом выполнения шага 6 является нижеприведенный SQL-скрипт:

```

4 Вывод

В ходе лабораторной работы было выполнено реализация схемы базы данных по ранее построенной реляционной схеме данных, были сформированы SQL-запросы для создания таблиц базы данных и выполнены их в СУБД, также были заполнены эти таблицы.
